# CUSTOMER PERSONALITY ANALYSIS

## description

It's all about understanding who your customers are, what they like, what they need, and how they behave.

businesses can tweak their products or services to better fit what their customers want.

businesses can figure out which group of customers is most likely to want their new product. Then, they can focus their efforts on marketing specifically to that group.

#### target

train a predictive model which allows the company to maximize the profit of the next marketing campaign

## IMPORTING OUR LIBs, DATASET

import numpy as np import pandas as pd import seaborn as sns **import** matplotlib.pyplot **as** plt from sklearn.preprocessing import StandardScaler from sklearn.decomposition import PCA from sklearn.metrics import silhouette score from sklearn extra.cluster import KMedoids from mpl\_toolkits.mplot3d import Axes3D from scipy.cluster.hierarchy import dendrogram, linkage from sklearn.cluster import AgglomerativeClustering

df.isna().sum().to\_frame()

1 - We found that only one column has missing values about 24 values so we drop this rows away by

ID 0 Year\_Birth Education Marital Status Income 24 Kidhome Teenhome Dt\_Customer Recency **MntWines MntFruits MntMeatProducts MntFishProducts MntSweetProducts** MntGoldProds 0 **NumDealsPurchases** 

```
df = df.dropna()
 df.isna().sum().sum()
 Now is clean from missing values
 It is the turn of dropping duplicates
 df.duplicated().sum()
 0
Detecting outliers in age of customers
 df = df[df['age']<90] #removing outliers
```

#### CLEANING OF OUR DATASET

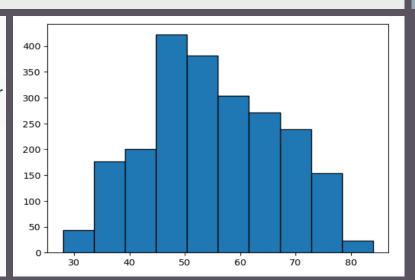

# We concluded that there is No duplicates

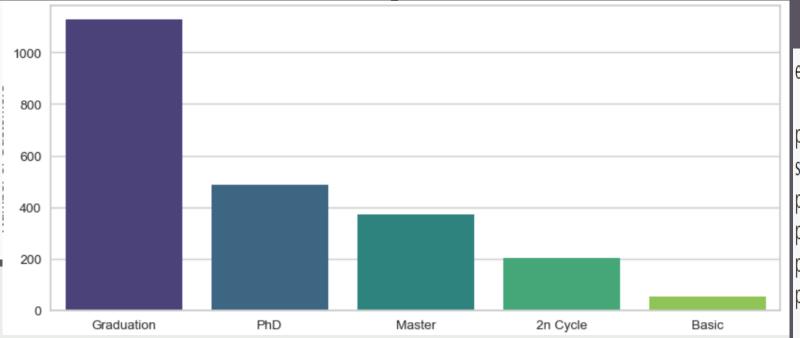

## **Exploratory Data Analysis**

#### df['age'] = 2024 - df['Year\_Birth'] # age of customers df.drop('Year\_Birth', axis=1, inplace=**True**)

df['years\_joined'] = 2024 - df['Dt\_Customer'].dt.year df.drop('Dt\_Customer', axis=1, inplace=**True**)

fig, ax = plt.subplots()
ax.hist(df['age'],edgecolor='black');

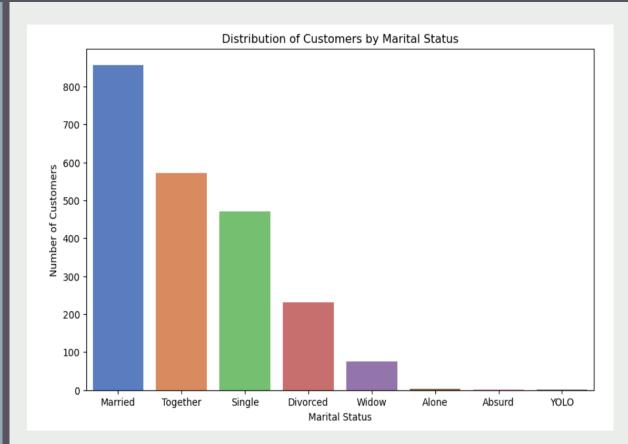

#### We can conclude:

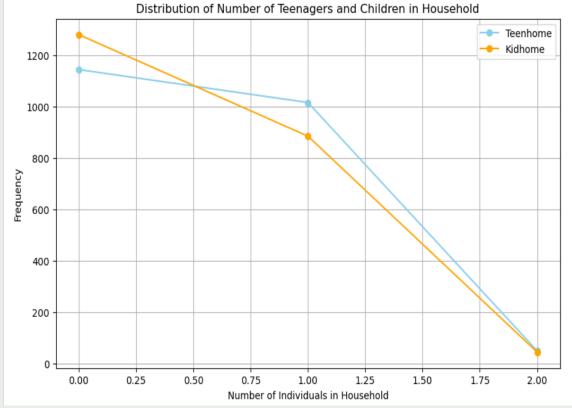

1- avg age is 55

2 – most of the customers are have graduated from schools (PhD – master – 2n cycle)

```
education_counts = df['Education'].value_counts()

plt.figure(figsize=(10, 6))
sns.barplot(x=education_counts.index, y=education_counts.values, palette='viridis')
plt.xlabel('Education Level')
plt.ylabel('Number of Customers')
plt.title('Distribution of Customers by Education Level')
plt.show()
```

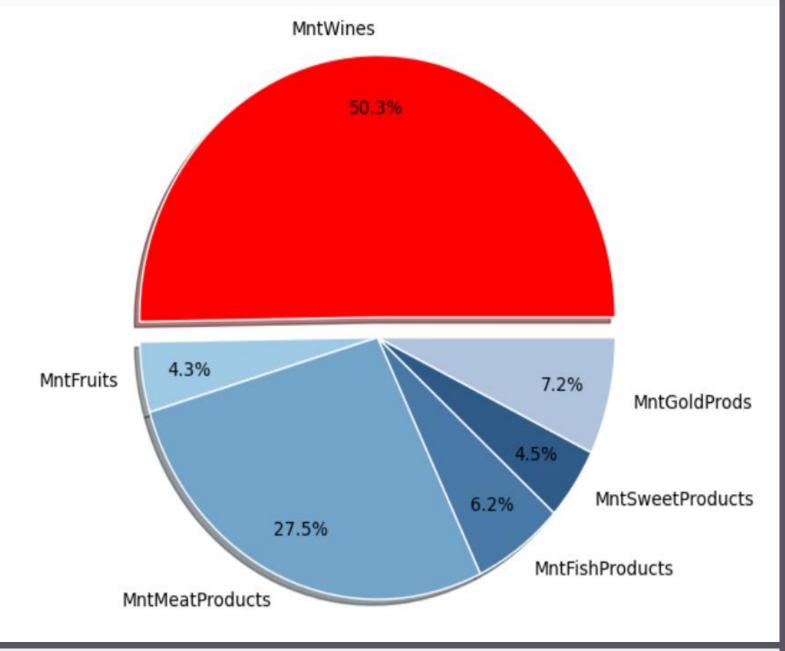

Most customers are married, followed by those who are in a relationship, and then those who are single.

Most customers have no children or one child

teen\_counts = df['Teenhome'].value\_counts() kid\_counts = df['Kidhome'].value\_counts()

```
Color = ["red", "#9FCAE6", "#73A4CA", "#497AA7", "#2E5B88", "#B0C4DE"]

fig ,ax = plt.subplots()

ax.pie(AmountSpentLastTWoYEAR ,labels = Labels ,radius = 1.3 ,colors = Color ,

shadow = True , autopct = '%1.1f%%' , pctdistance = 0.8 ,

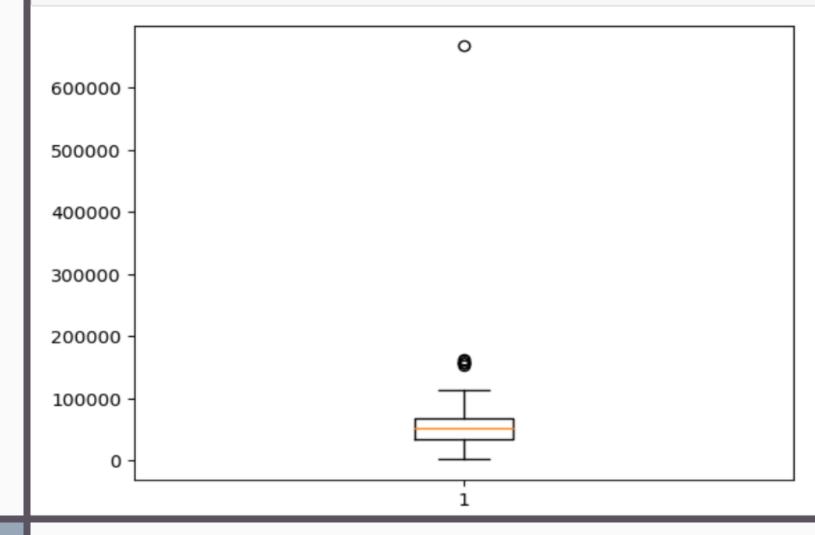

explode = [0.1,0,0,0,0,0] ,

wedgeprops ={"linewidth": 1, "edgecolor": "white"});
```

We can see that the amount spent on wine products is the largest amount spent overall products in the last 2 years

Customer's yearly household income 75k \$ AVG

fig, ax = plt.subplots()
ax.boxplot(df['Income']); #Customer's yearly household income

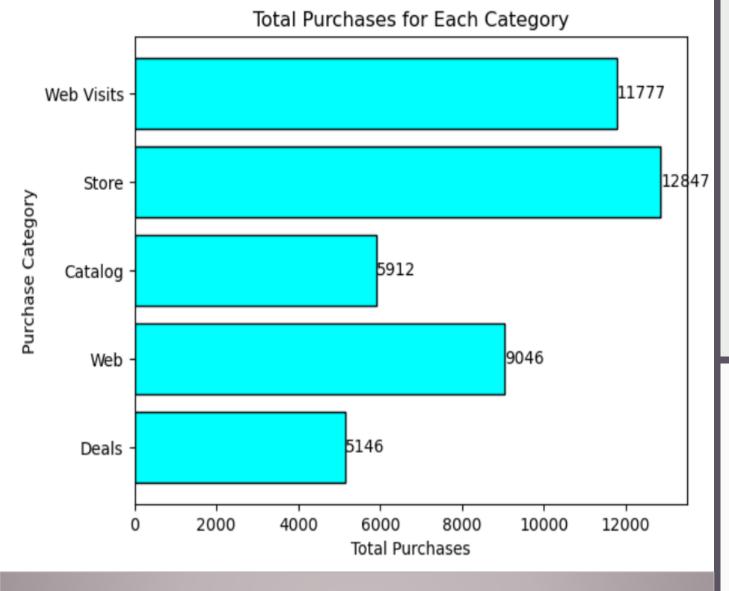

```
Q1 = df['Income'].quantile(0.25)
Q3 = df['Income'].quantile(0.75)
IQR = Q3 - Q1
lower_bound = Q1 - 1.5 * IQR
upper_bound = Q3 + 1.5 * IQR|
df = df[(df['Income'] >= lower_bound) & (df['Income'] <= upper_bound)]
df['total_purchases'] = df[['NumDealsPurchases', 'NumWebPurchases', 'NumCatalogPurchases', 'NumStorePurchases', 'NumWebVisitsMonth']].sum(axis=1)
#segmentation of Customer Incomes
income_bins = [0, 20000, 40000, 60000, 80000, 100000, 120000]
income_labels = ['0-20000', '20001-40000', '40001-60000', '60001-80000', '80001-100000', '100001-120000']
df['Income_Category'] = pd.cut(df['Income'], bins=income_bins, labels=income_labels)
income_purchase_mean = df.groupby('Income_Category')['total_purchases'].mean()
```

#### Detecting Outliers and filter data from them

#### Speaking engagement metrics

Impact factor	Measurement	Target	Achieved
Audience interaction	Percentage (%)	85	88
Knowledge retention	Percentage (%)	75	80
Post-presentation surveys	Average rating	4.2	4.5
Referral rate	Percentage (%)	10	12
Collaboration opportunities	# of opportunities	8	10

We found something interesting:
Web visits in the last month was massive compared to
the transactions (web) as the avg age of the dataset is
56

```
pur = [
    df['NumDealsPurchases'].sum(),
    df['NumWebPurchases'].sum(),
    df['NumCatalogPurchases'].sum(),
    df['NumStorePurchases'].sum(),
    df['NumWebVisitsMonth'].sum()
]

labels = ['Deals', 'Web', 'Catalog', 'Store', 'Web Visits']

plt.barh(y=range(len(pur)), width=pur, color="cyan", edgecolor='black',capsize=10)
plt.yticks(ticks=range(len(pur)), labels=labels)

for i, val in enumerate(pur):
    plt.text(val, i, str(val), ha='left', va='center')

plt.xlabel('Total Purchases')
plt.ylabel('Purchase Category')
plt.title('Total Purchases for Each Category')
plt.show()
```

After conducting a thorough analysis: it's evident that the majority of purchases, totaling 12,841, are made in-store, making it the highest channel for transactions.

Following closely behind are purchases through web at 9,042 transactions deals and catalogs represent the lowest volume

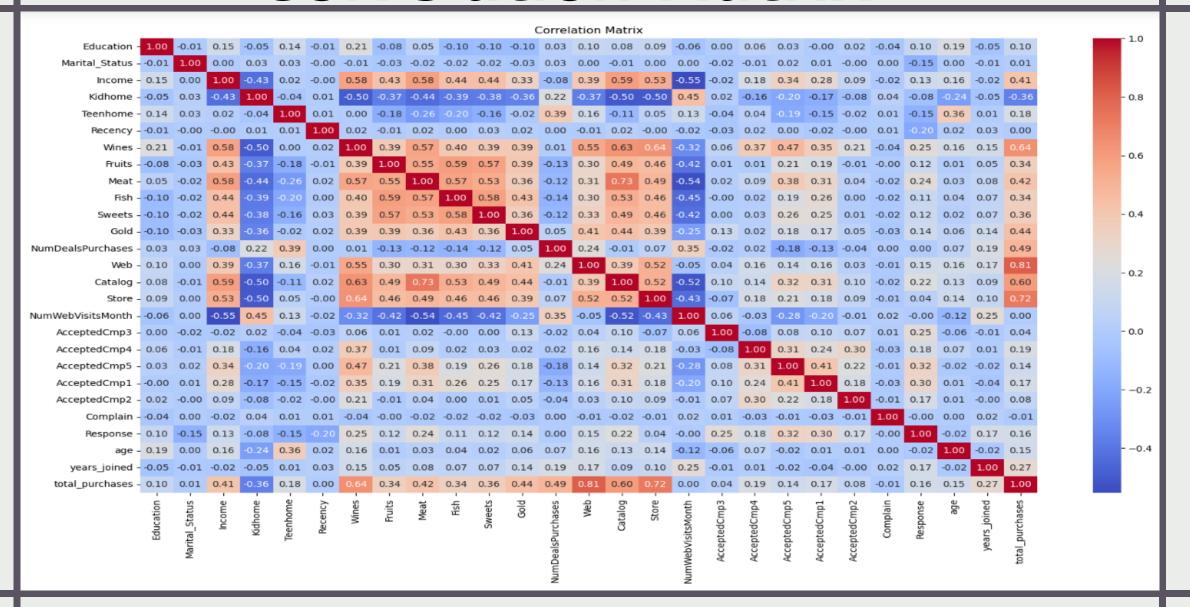

of transactions.

#### preprocessing

## before Clustering

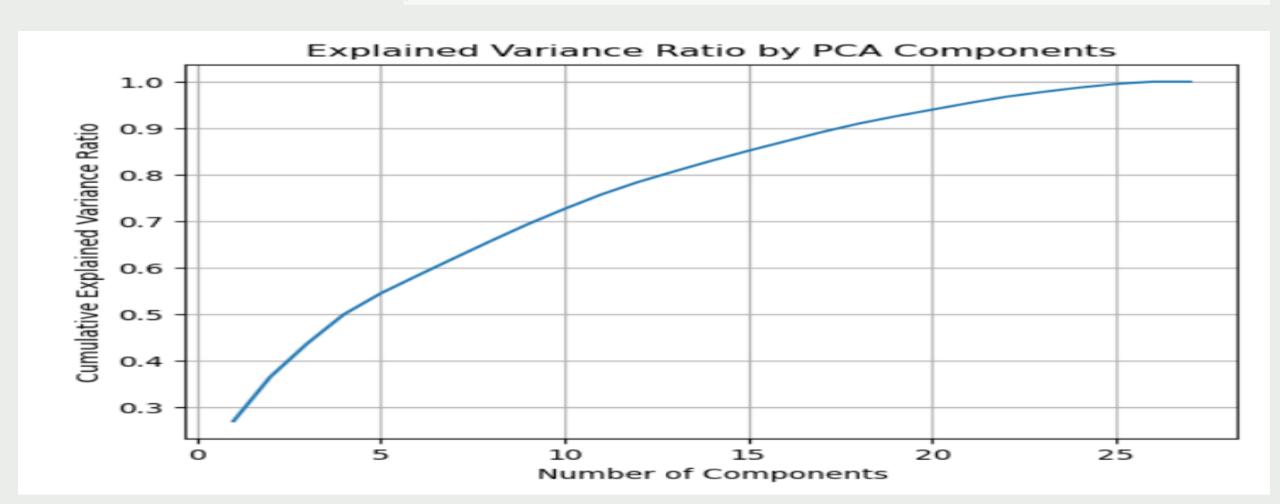

```
# limit values
data = df.drop(['ID','Z_CostContact', 'Z_Revenue', 'Income_Category'], axis=1)
data['Marital Status']=data['Marital Status'].replace({'Divorced':'Alone','Single':'Alone','Married':'couple','Together':'couple','Absurd':'Alone','Widow':'Alone','YOLO
# data['Education']=data['Education'].replace({'Basic':'Undergraduate','2n Cycle':'Undergraduate','Graduation':'Postgraduate','Master':'Postgraduate','PhD':'Postgraduate'
data=data.rename(columns={'MntWines': "Wines", 'MntFruits': 'Fruits', 'MntMeatProducts': 'Meat', 'MntFishProducts': 'Fish', 'MntSweetProducts': 'Sweets', 'MntGoldPro
data=data.rename(columns={'NumWebPurchases': "Web", 'NumCatalogPurchases': 'Catalog', 'NumStorePurchases': 'Store'})
data.columns
category order = ['Basic', '2n Cycle', 'Graduation', 'Master', 'PhD']
data['Education'] = pd.Categorical(data['Education'], categories = category order, ordered = True)
data['Education'] = data['Education'].cat.codes
mapping = {'Alone': 1, 'couple': 2}
data['Marital Status'] = data['Marital Status'].map(mapping)
data.head()
scaler = StandardScaler()
scaled_data = scaler.fit_transform(data)
scaled data = pd.DataFrame(scaled data, columns=data.columns)
scaled data.head()
```

#### **Correlation Matrix**

there are correlated features, and the dimensionality is high, so we do PCA

```
pca = PCA()
pca.fit(scaled_data)
cumsum = np.cumsum(pca.explained_variance_ratio_)
plt.plot(range(1, len(cumsum) + 1), cumsum) # Plot component number vs. cumulative explained variance ratio
plt.xlabel('Number of Components')
plt.ylabel('Cumulative Explained Variance Ratio')
plt.title('Explained Variance Ratio by PCA Components')
plt.grid(True)
plt.show()
```

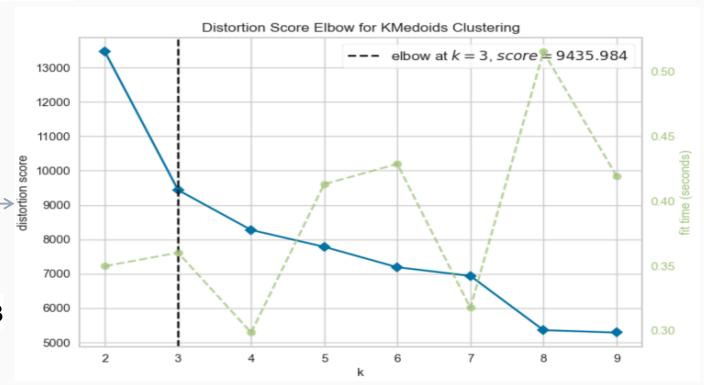

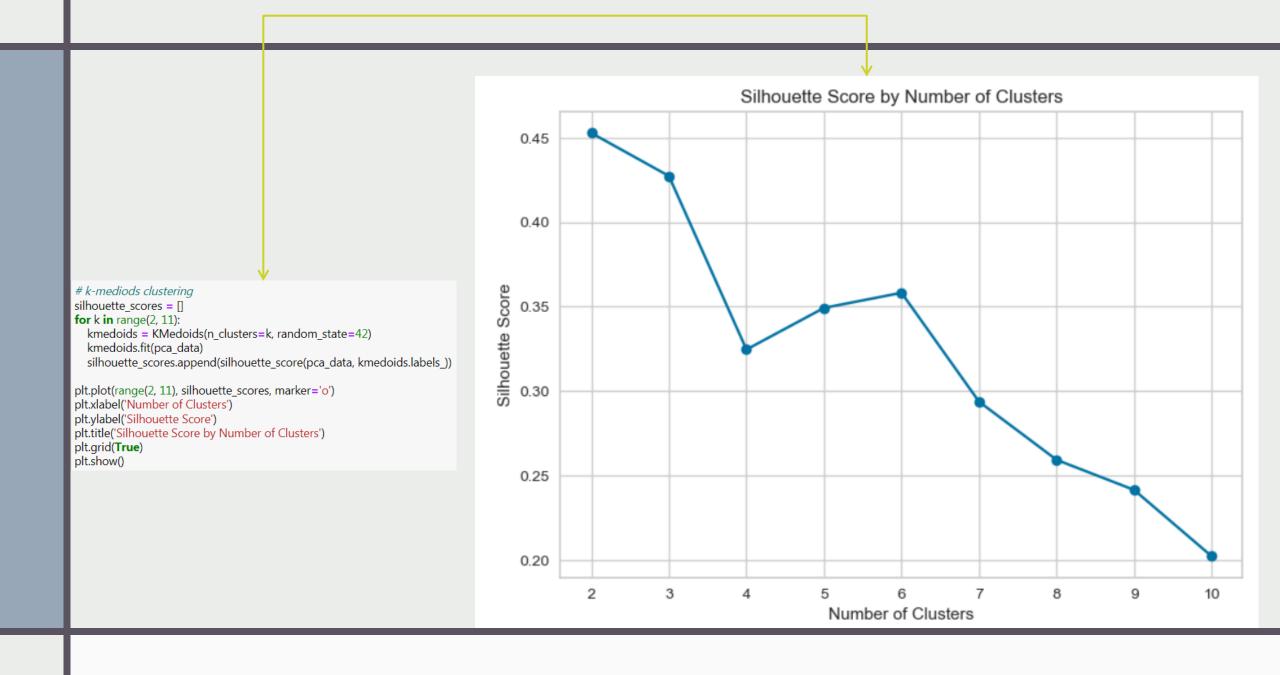

# K-MEDOID

WE MUST DECIDE HOW MANY CLUSTERS BEFORE BEGAIN WITH K-MEDOID SO WE CAN APPLY **Elbow For K-Medoids** 

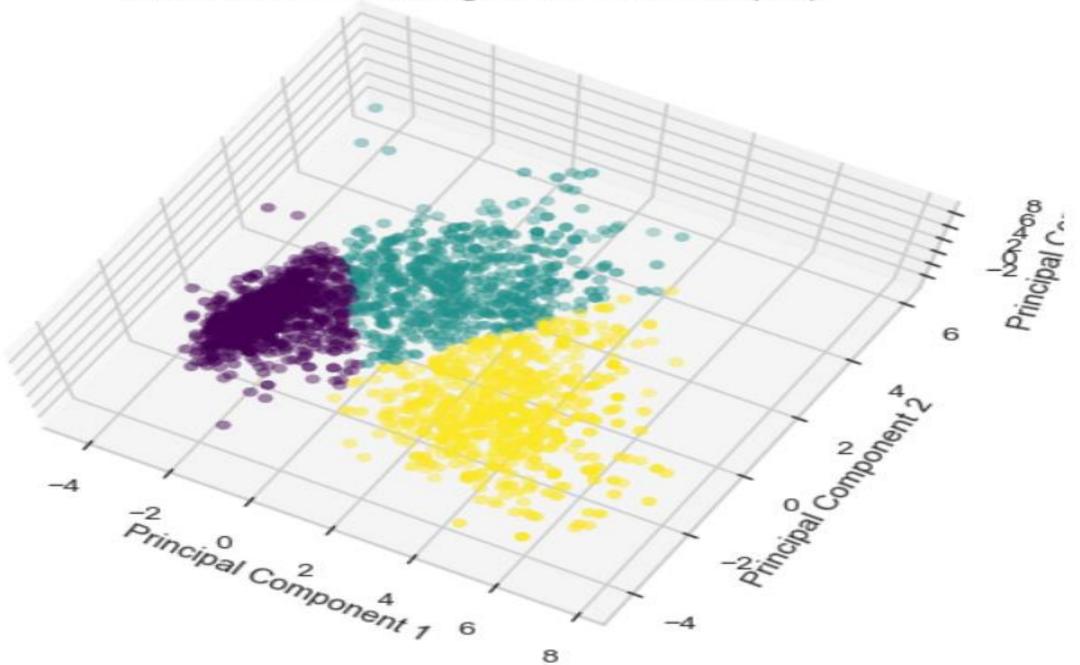

from yellowbrick.cluster import KElbowVisualizer from sklearn\_extra.cluster import KMedoids model = KMedoids() visualizer = KElbowVisualizer (model, k=(2,10)) visualizer.fit(pca\_data) visualizer.show()

After Elbow, We can see that the appropriate number of clusters is 3

K-Medoids Clustering with 3 Clusters (3D)

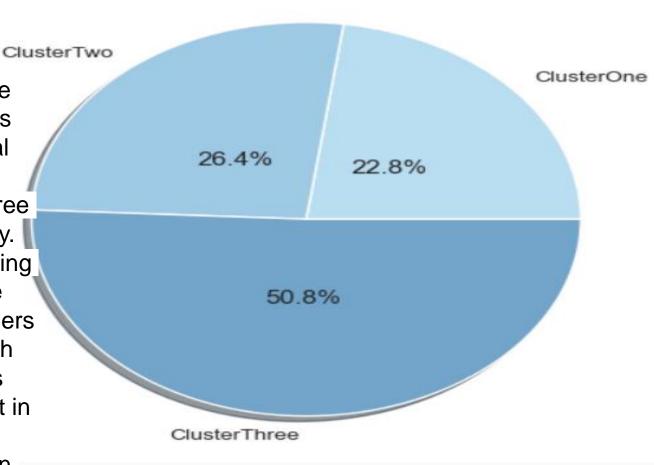

# group by clusters

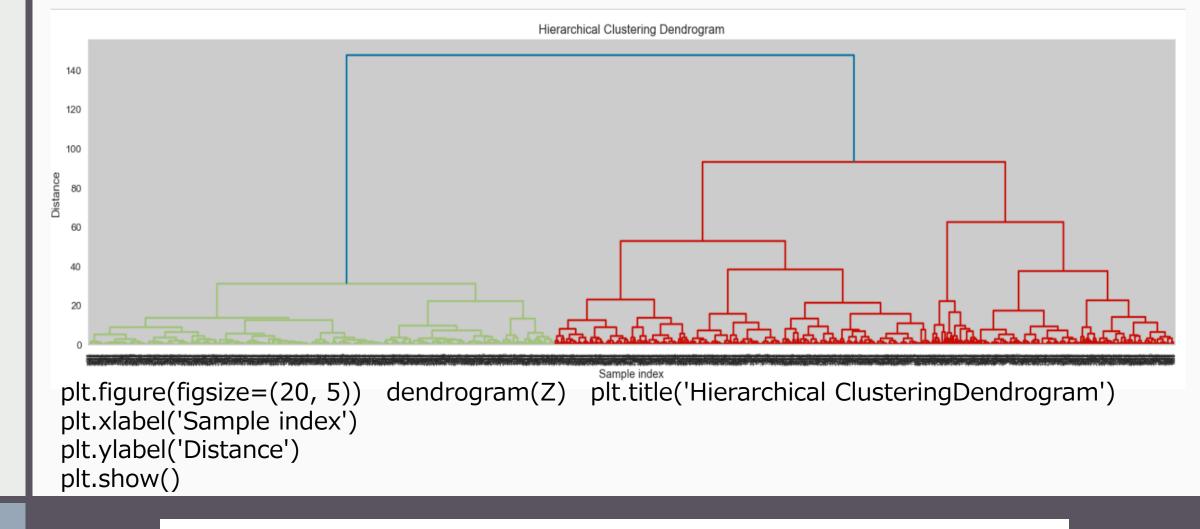

```
cluster_groups_mean = data.groupby(['cluster']).agg({
  'Income': 'mean'.
  'age': 'mean'.
                                        #Separate data by each cluster among three clusters
  'years joined': 'mean',
                                        c1 = data[data['cluster'] == 0]
  'total purchases': 'mean',
  'Wines': 'mean',
                                        c2 = data[data['cluster'] == 1]
  'Fruits': 'mean',
                                        c3 = data[data['cluster'] == 2]
  'Meat': 'mean',
  'Fish': 'mean',
                                        # Calculate response rates for each cluster
  'Sweets': 'mean'.
  'Gold': 'mean'.
                                        cluster_groups_sum['Response Rate'] = (cluster_groups_sum['Response'] / cluster_groups_sum['Response'].sum()) * 100
  'NumDealsPurchases': 'mean'.
  'Web': 'mean'.
  'Catalog': 'mean',
  'Store': 'mean',
  'NumWebVisitsMonth'. 'mean'.
  'AcceptedCmp3': 'sum',
  'AcceptedCmp4': 'sum',
  'AcceptedCmp5': 'sum',
  'AcceptedCmp1': 'sum',
  'AcceptedCmp2': 'sum',
  'Complain': 'sum',
  'Response': 'sum'
cluster groups sum = data.groupby(['cluster']).sum()
```

Cluster three exhibits the highest campaign response rate among all clusters. This indicates that a larger proportion of customers in cluster three responded positively to the marketing campaigns compared to customers in other clusters.

Based on the analysis, it's clear that people in cluster three respond better to marketing campaigns. This means stores have a chance to make the most of this by creating special marketing plans just for them. By doing this, stores can make sure they're offering things that people in cluster three like, which can help them sell more and make more money. In addition to having the most positive response to marketing campaigns, cluster three stands out with its higher income level and an average age of around 55. Moreover, customers in this cluster tend to spend more on various products such as meat, wine, gold, fish, sweets, and fruits. This indicates that they have both the means and the inclination to invest in higher-quality products. Stores can use this information to make their marketing plans better. They can focus more on selling high-quality products and giving special deals to people in cluster three. By doing this, stores can make customers in this group happier and sell more, which means they'll make more money in the end.

#### Campign Response rates for each cluster

## Hierarchical clustering

```
agglo = AgglomerativeClustering(n clusters=2)
agglo.fit_predict(pca_data)
                                                             cluster_groups_mean = data.groupby('agglo_cluster').agg({
data['agglo_cluster'] = agglo.labels_
                                                                 'Income': 'mean',
                                                                 'age': 'mean',
                                                                 'years_joined': 'mean',
                                                                 'total purchases': 'mean',
                                                                 'Wines': 'mean'.
                                                                 'Fruits': 'mean',
                                                                 'Meat': 'mean',
                                                                 'Fish': 'mean',
                                                                 'Sweets': 'mean',
                                                                 'Gold': 'mean'.
                                                                 'NumDealsPurchases': 'mean',
                                                                 'Web': 'mean',

We notice the following:

- cluster 0 has high avg income while cluster 1 has low avg income
- cluster 0 spend more in avg and respond more to deals
- cluster 1 visit the website more often while cluster 0 buy from website more
- cluster 1 tend to complain more than cluster 0

#### **Comparing clusters**

**Both clusters** spend the same proportion with different amounts (cluster 0 spends more)

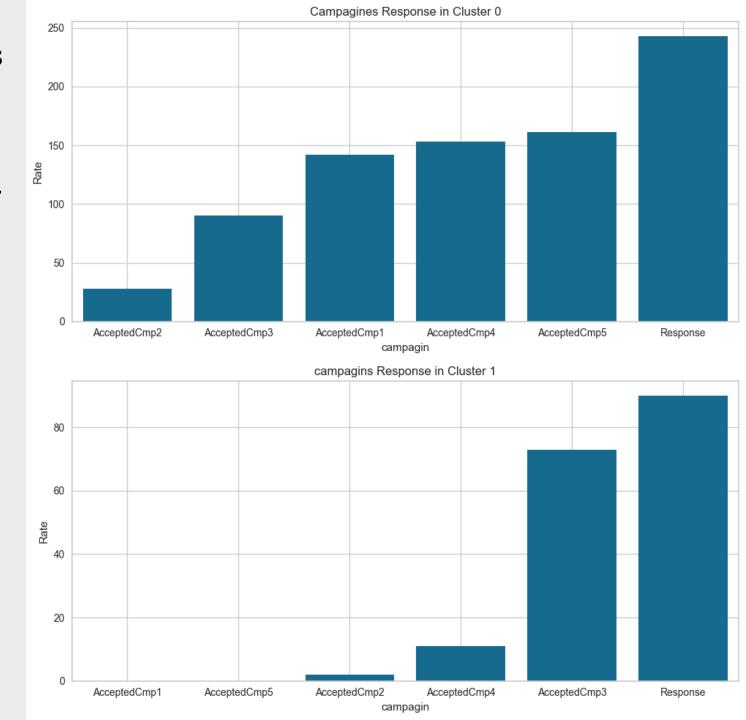

Last campaign targeted both clusters the most

#### Cluster 0:

They responded most to camp 5, 4, 1 While camp 2 was not suitable for them.

#### Cluster 1:

They responded most to cluster 3
Got low responses in 2, 4
And never accepted camp 1, 5 they
were not targeting this cluster of
customer

#### Evaluation

 both clustering methods gave similar silhouette score at the chosen number of clusters

 while kmediods gave best fit at 3 clusters, hierarchical clustering gave best fit at 2 clusters

 both methods provided valuable insights into customer segmentation, offering different perspectives on grouping customers and which campaigns targeted them the most which will help in targeting them in future campaigns.
